Getting Started in Aquaculture Information Session

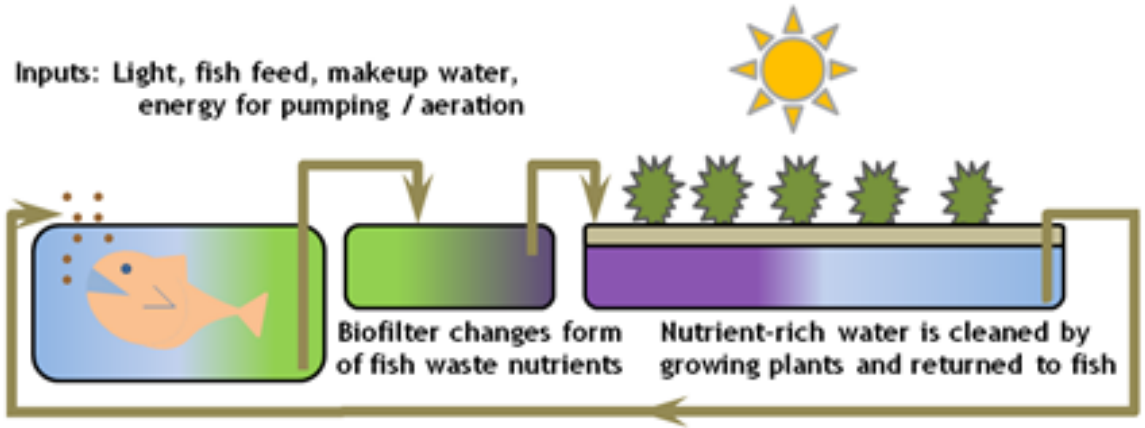
Aquaponics

CANADIAN AQUACULTURE SYSTEMS INC.
BIOENGINEERING TECHNOLOGIES & BUSINESS MANAGEMENT SOLUTIONS

Daniel Stechey
(905) 377-8501 stechey@cogeco.ca

Why Aquaponics?

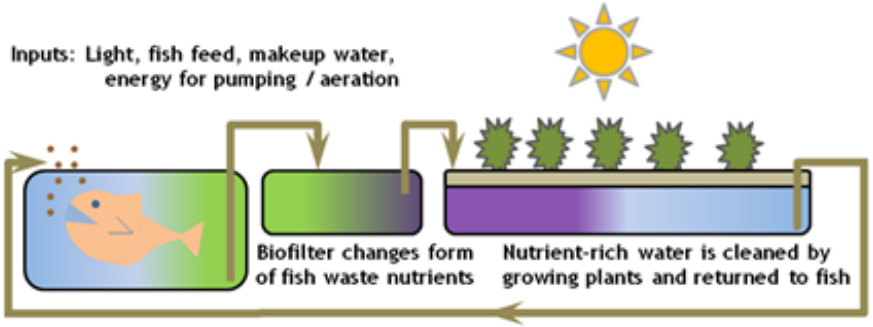
- Nitrate is a by-product in intensive aquaculture systems and must be removed
- Denitrification systems can be complex and add an additional cost
- Plants provide a denitrification function and provide an additional saleable crop



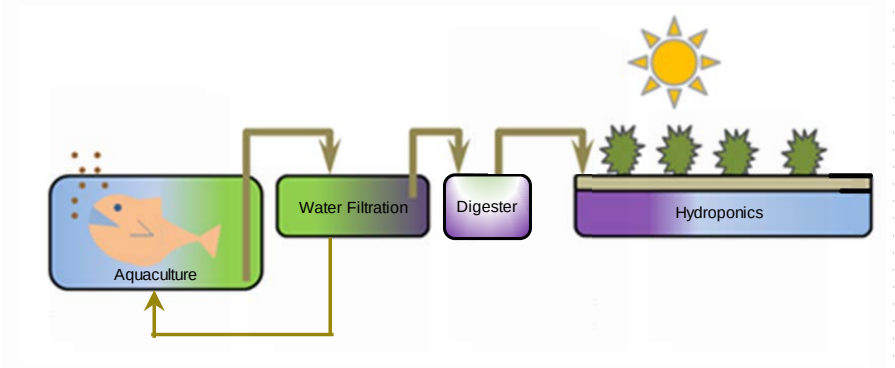
www.sfi.mtu.edu

Coupled v. De-Coupled Systems

- Coupled Systems
  - Common water for fish and plants



- De-coupled Systems
  - Independent recirculation systems for fish and plants
  - Nutrients are digested and then transferred to plants



Media Bed Technique

- Inert medium (clay balls, coco fibre) used to secure roots
- Beds flooded and drained or drip-irrigated
- Advantages:
  - High surface area for growth of beneficial bacteria in root zone
  - Excellent for vine crops
- Disadvantages:
  - In coupled aquaponics, media can trap solids and promote growth of deleterious bacteria

Deep Water / Raft Technique

- Common in aquaponics
- Plants float on rafts
- Advantages:
  - Allows for well-mixed, aerated troughs
  - Relatively low risk
  - Water volume provides thermal mass for stable temperatures
- Disadvantages:
  - Structural requirement to support weight of water
  - Solids settling in tanks

Nutrient Film Technique

- Plants placed in shallow troughs with fast-flowing water
- Advantages:
  - Higher plant densities
  - Lower weight enables vertical stacking

Fresh City Farms, Canada

Aqua Greens, Mississauga, ON

Trend AquaFresh Organics, Niagara

- 50 tonnes annual fish production
- 400,000 – 600,000 heads of leafy vegetables
- Organic certification for fish and vegetables

GlobalTRUST an SAI GLOBAL company

Standards Council of Canada
Conseil canadien des normes

AQUAPONICS Economics

Completed Builds	sq Ft	Total Cost	Cost per Sq ft
Hong Kong	25,833	$400,000	$15.48
Bahrain	4,306	$200,000	$46.45
Oman	4,306	$100,000	$23.23
Toronto*	2,000	$19,000	$9.50
Newmarket^*	1,000	$42,000	$42.00
India	3,200	$60,000	$18.75

**Volunteer Labour only* **Indoor Systems*

Capital Expense

- Cost to build systems varies by **300**%
  - High - $45 sq. / ft.
    - 25+ year lifespan, concrete or FRP
    - Artificial Lighting
  - Low - $10.00 / sq. ft.
    - Lumber + Liner
    - Volunteer Labour

Production

- Production Estimates Vary Wildly
- Forecast from LEARNED EXPERIENCE
- Importance of phased build-out
- Feasibility, Partners, Human Capital

Retail Prices

- Organic up to +40% higher prices,
- Can you get certified?
- CSA vs. Retail vs. Farmers Markets
- Institutional Opportunities

WATERFARMERS AQUAPONICS

AQUAPONICS Canadian Challenges

- Heating
- Artificial Lighting – bulb type, LED, waste heat output, Lumens, cost
- Risk is not well understood
- Supply chain is not well established
- Lack of human capital
- Steep learning curve
- Few commercially successful operations, no ‘models’

WATERFARMERS AQUAPONICS

Aquaponics v. Hydroponics

- Purdue University study (Flores et al. 2018)
  - Two experimental systems for production of basil, lettuce and cherry tomato
  - One aquaponics (tilapia) and one hydroponics (commercial fertilizers)
  - Capital cost was 8% higher for aquaponics
  - Operating cost was 12% higher for aquaponics

Table 1 – Financial results for aquaponics and hydroponics

Results	Hydroponics	Aquaponics			
		Non-organic prices	10% veg. price increase	20% veg. price increase	30% veg. prices increase
IRR (%)	48.7	18.27	32.61	45.83	58.51
NPV ($)	73,872	20,144	47,447	74,750	102,052
Payback (yrs)	3.13	6.83	4.04	3.25	2.79
Benefit/Cost	1.36	1.11	1.22	1.32	1.43

Moose Cree First Nation Aquaponics
An Opportunity for Remote Communities

- Local production of nutritious fish and vegetables on a year-round basis leading to healthier diets
- More reasonable prices for fresh fish and vegetables
- Enhanced food security and self-sufficiency
- An opportunity to provide diversified experiences for youth and other community members
- Integrated with the science and culinary arts programs in the school system
- Employment opportunities within the community
- Potential spin-off opportunities utilizing by-products from the operation (e.g. processing by-products)

Moose Cree First Nation

Products

Fresh, farmed-raised fish and vegetables

Moose Cree First Nation

- Fresh rainbow trout
  - ~1,000 kilograms of fish / month
  - 250 kg per week
- Leafy vegetables
  - ~65,000 heads per year
  - Lettuces, basil, spinach, herbs, etc.
- Specialty Crops (in future)
  - Strawberries

Dutch Buckets

Nutrient Film Technique

Deep Water Raft Culture

Business Model

All-female triploid eggs purchased from Troutlodge

Juvenile fish raised in local high school

Fish Production

Competitive tender: Fish feed supply

Fish Harvest

Nutrient separation & digestion

Vegetable Production

Seed Propagation

$

Moose Cree Aquaponics

Training
QC/QA

Moose Cree First Nation

Community Model

- Developing a related curriculum for implementation in the local school is a key part of the initiative

Aquaculture

- Students will produce juvenile trout for on-growing in the venture
- Key curriculum components:
  - Biology
  - Environment
  - Mathematics
  - Chemistry

Hydroponics

- Students will propagate seedlings for on-growing in the venture
- Key curriculum components:
  - Biology
  - Environment
  - Mathematics
  - Chemistry

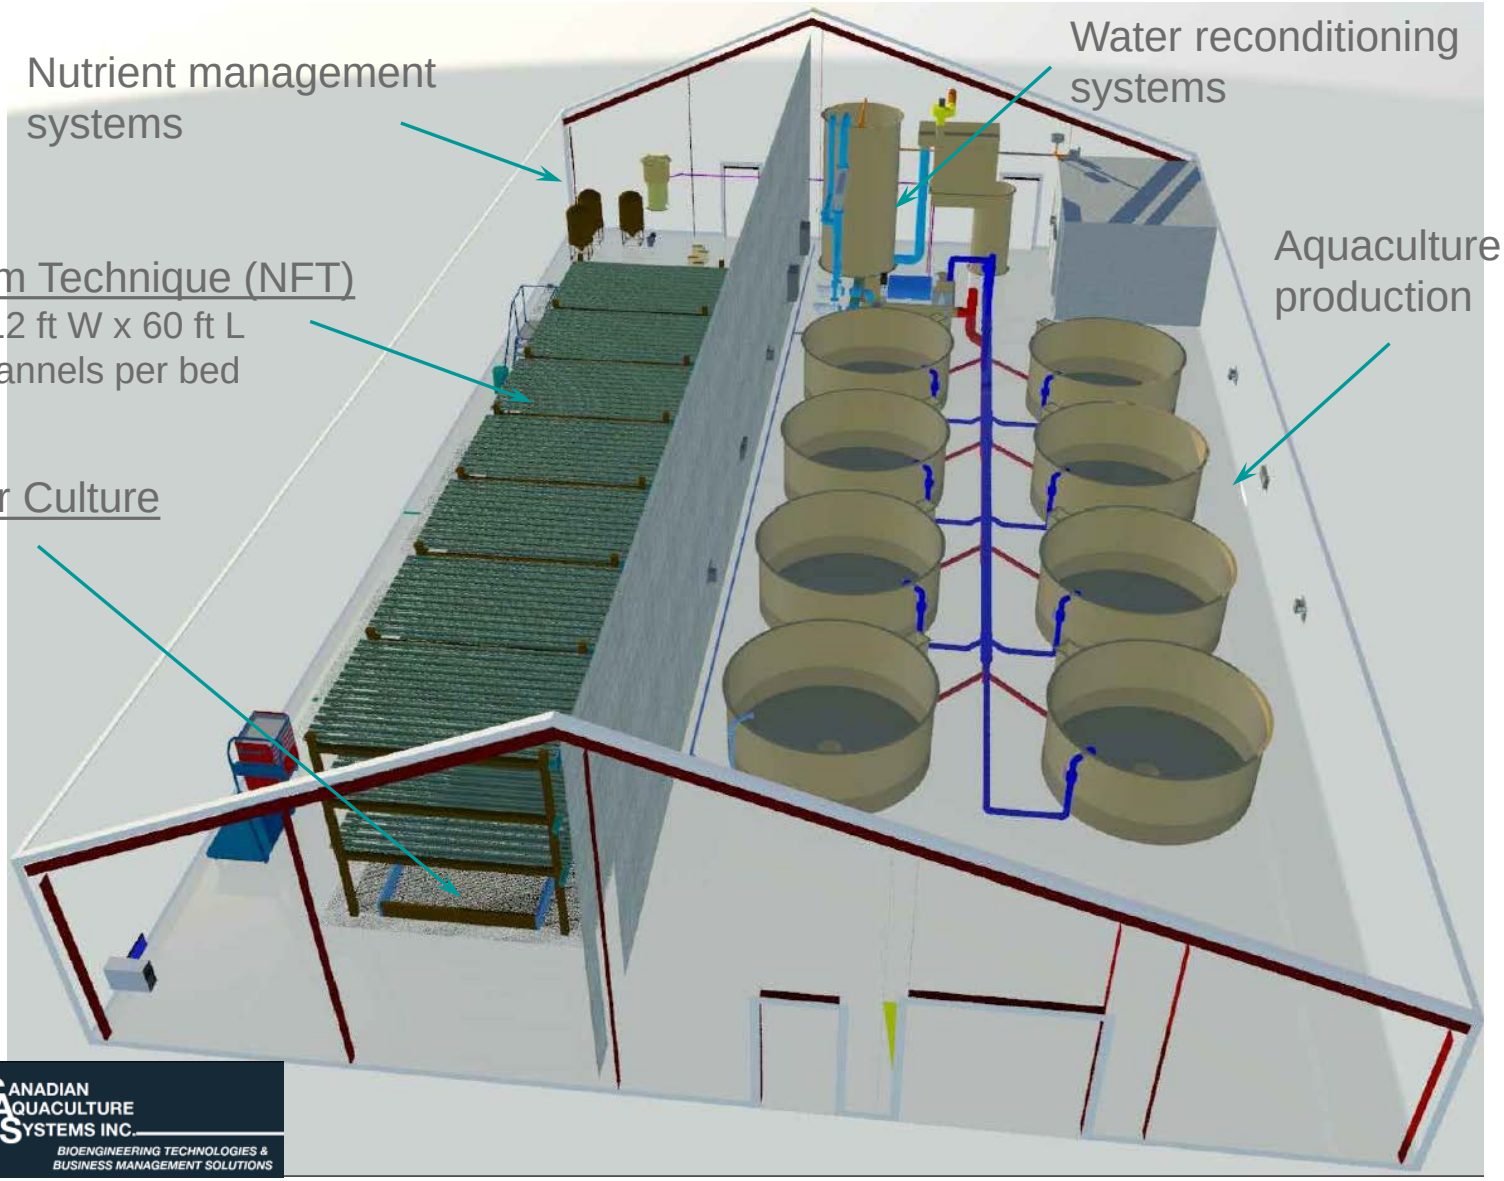
Culinary Arts

- Students will prepare meals using fish and vegetables from the venture
- Key curriculum components:
  - Food Preparation
  - Health & Nutrition
  - Food Safety

Moose Cree First Nation

Aquaponics Venture

Moose Cree First Nation



Nutrient Film Technique (NFT)

- 3 beds at 12 ft W x 60 ft L
- 90 NFT channels per bed

Deep Water Culture

- 8 ft x 60 ft
